The Blueprint for Core Investing

"What's needed [to invest successfully over a lifetime] is a sound intellectual framework for making decisions and the ability to keep emotions from corroding that framework."

Preface by Warren Buffett

The Intelligent Investor
by Benjamin Graham

The recent bear market has spawned a profound change in investment thinking. Wary of Wall Street and the frailty of major financial institutions, investors have experienced acute risk aversion. The buy and hold approach has fallen short, and the notion that best of breed money managers can mitigate volatile financial markets has been discredited.

Complacency has been swept away. Now investors must look ahead and find an acceptable strategy to meet their future financial objectives despite the frustrations and disappointments of the past. Some would have us believe that successful investing takes only Wall Street savvy, or that it is a right-brain gift of intuitiveness or creative thinking. Not likely — there is very little empirical evidence to suggest these qualities predict consistent success. The facts point as much to random luck as they do to distinguished bouts of manager outperformance.

Some "free rein" managers continue to bet on their ability to forecast the economy, identify superior asset class performers, and entry and exit to the stock market. These endeavors are difficult at best and at their worst hook investors to the rollercoaster of financial markets. Investing is not an art and portfolio managers are not artists. On the contrary: successful investing is mostly a left-brain function of mathematical calculation, we submit, and disciplined decision-making to control right-brain biases.

What the investor is seeking is an approach to investing that is successful, explainable, and has a high likelihood of repeating. An approach that would help them withstand the urge to submit to the emotional risk of investing that overwhelms rational thinking. Staying invested when confidence is low. Resisting the urge to take on more risk when confidence is high. Investors concede these are fundamental tenets to success, if only they knew how to follow them with a decent level of certainty.

The Blueprint for Core Investing is the EquityCompass approach to these investment challenges. Relying on objective criteria, sound investment principles, and consistent application, we believe the methodology presented in this report provides a reliable path for achieving successful investment results.

Executive Summary

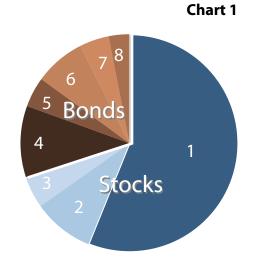

- The emotional or psychological risk in investing is a significant hurdle to achieving successful results. A core/satellite investment framework provides a flexible and practical approach to segregate risk for allocating investment assets. The core portfolio, comprised of traditional stocks and bonds, is the foundation for building and protecting long-term wealth.
- The EquityCompass approach to constructing a core portfolio has four components: (1)
 Strategic Asset Allocation provides the long-term perspective to allocate between stocks and bonds, (2) Tactical Asset Allocation delivers the risk mitigation or opportunistic strategies that adjust the strategic allocation to intermediate and near-term market conditions, (3) Portfolio Construction gives the specific guidelines for portfolio and security selection, and (4) Portfolio Management administers the rebalancing, risk monitoring, and maintenance of portfolio positions to remain consistent with investment principles.
- Time horizon is the critical element for allocating investment assets. Time lines that are too
 short or too long can overemphasize the expected risk and reward of investing in stocks and
 bonds. Historically, an allocation of 60% stocks and 40% bonds has been the optimal riskadjusted allocation for investors with a time horizon of five years. The 60/40 mix is the base
 allocation for the EC Core Portfolio.
- Financial markets that have extended performances above or below their historic norms should anticipate a period of mean reversion. These abnormal performance periods are reflected with a tactical adjustment to increase or decrease the allocation to stocks from their 60/40 mix. The tactical model for the EC Core Portfolio increased the allocation to 70/30 in January of this year to reflect the five-year trailing returns of stocks that was more than two standard deviations below their average.
- While strategic and tactical allocation decisions are based on historical performances, they do not necessarily reduce the emotional risk reacting to nearer-term market conditions. The understanding that an investment plan can provide some protection against a prolonged market decline better enables investors to stay invested during periods of market turbulence. The EC Core Portfolio incorporates a risk-management overlay using fundamental and technical indicators to further adjust the exposure to equities.
- The equity allocation of the EC Core Portfolio is comprised of active and passive strategies investing in domestic and international stocks. The active portion follows the EquityCompass U.S. All-Cap Blend Model portfolio that seeks to outperform with a strategy designed to neutralize biases to investment style, market-cap segment, and sector representation.
- The fixed-income strategy of the EC Core Portfolio emphasizes credit quality and capital stability. The strategy does not engage in active management such as interest rate anticipation, sector swaps, yield curve spreads, or quality spreads. The portfolio will not own high-yield or foreign bonds.
- Using a benchmark annually rebalanced to 60% S&P 500 and 40% Barclays U.S. Aggregate
 Bond Index, we simulate the comprehensive decision-making criteria of the EC Core
 Portfolio. In the 115 month study period, the core strategy provided significantly lower
 volatility and excess return to the benchmark. We attribute excess return to multiple sources,
 which we believe is a major positive and illustrative of combining focused and incremental
 decision-making to produce successful overall investment results.

Core/Satellite Investment Approach

As investors accumulate wealth, their needs progress from safety and liquidity to creating and protecting wealth consistent with longer-term financial objectives. An investment approach that provides the flexibility and focus to accommodate a lifetime of investing is known as core/satellite. This approach incorporates accepted asset allocation theory with the practical realities of investing.

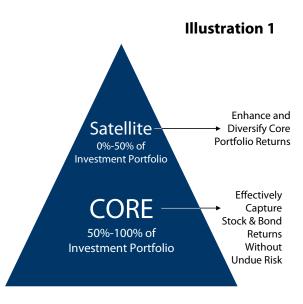

Core/Satellite is an approach to asset allocation incorporating sound theory and the practical realities of investing.

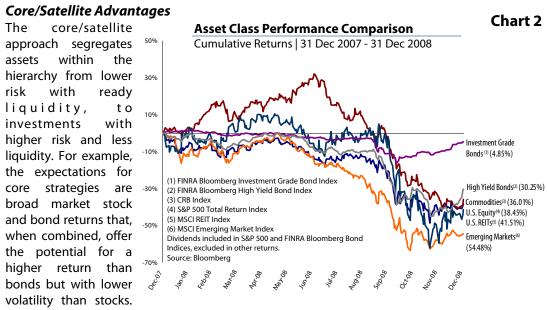

Core

The foundation of this approach is a core investment strategy. The objective of the core portfolio is to reliably and effectively capture market returns. A broadly diversified stock and bond portfolio is designed to accomplish this objective. A key consideration of core investing is the time horizon for allocating between stocks and bonds and among major stock/bond sub-classes. For most investors, the core portfolio should represent the majority of their investment and the foundation for supporting the use of more dynamic investments in the satellite category.

Satellite

Satellite investment strategies, on the other hand, are designed for the flexibility to pursue a range of objectives to augment core investments. While the core seeks to capture market returns, the satellite portfolio seeks to enhance them. The satellite portfolio may include Alpha strategies to enhance core portfolio returns without non-core constraints such as overweighting sectors or stocks, use of leverage, and short selling. Alternative strategies diversify core portfolios with other asset classes such as high yield bonds, real estate, commodities, and absolute return strategies. Strategic satellite strategies are specific to the unique needs, opportunities, and desires of an investor.

Satellite strategies are more narrowly focused and should be evaluated by their relevant risk and return factors that are greater than, or different from, a broader core portfolio.

Core/Satellite vs. Conventional Allocation Approaches

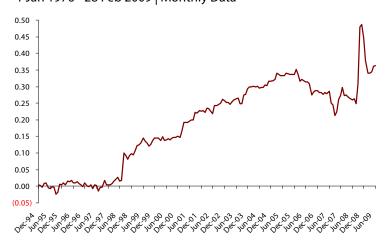

Conventional asset allocation theories use historical risk/return correlation of asset classes to identify an optimal portfolio mix. Known as Modern Portfolio Theory (MPT), this approach provides a logical framework to diversifying assets. However, the bear market in 2008 undermined the MPT's effectiveness as asset classes became highly correlated, and as expected, reduced the benefit of diversification (**Charts 2** and **3**).

MPT's diversification benefit was reduced in 2008 as asset classes became highly correlated.

This bear market highlighted certain other weaknesses of MPT. First, the assumption that investors will maintain their same level of risk throughout tolerance investment cycle is unrealistic. Investors' perception of risk in 2009 is doubt very no different from an asset allocation implemented in 2007. Second, asset classes are becoming commoditized, due to the increased securitization and globalization of financial markets. This is likely increasing correlations from their historical past. In other words, the optimal mix of asset classes is difficult to identify because the historical correlations are a less reliable proxy for future correlations.

Chart 3

Source: Ned Davis Research

Core/satellite incorporates aspects of MPT as a sound construct for asset allocation, and builds upon it to create a pragmatic and flexible approach to investing.

The EquityCompass Approach to Constructing a Core Portfolio

EquityCompass believes that a core portfolio should seek to effectively capture market returns while minimizing the risk of underperformance. Like index funds, it should offer broad diversification and track relevant benchmarks; and like traditional funds, it should offer active management and superior stock selection to potentially outperform.

We have adopted a four-step investment process to building our version of the core portfolio ("EC Core Portfolio" or the "Portfolio"). The important consideration of a core strategy is the investment process that guides decision-making.

There are four components:

- Strategic Asset Allocation provides the long-term perspective anchoring the allocation between stocks and bonds to achieve expected financial returns
- II) **Tactical Asset Allocation** delivers the risk mitigation or opportunistic strategies that adjust the strategic asset allocation to intermediate and near-term market conditions
- III) Portfolio Construction gives specific guidelines for portfolio and security selection
- IV) **Portfolio Management** administers the rebalancing, risk monitoring, and maintenance of portfolio positions to remain consistent with investment principles

In each of these components, *Blueprint* presents specific decision-making criteria that we believe incrementally add value and when combined, provide a fully synchronized approach to successful investing.

Like index funds, a core portfolio should offer broad diversification and track relevant benchmarks; and like traditional funds, it should offer active management and superior stock selection to potentially outperform.

I. Strategic Asset Allocation

The variability of returns is greatest in the short-term, and time horizon is an important determinant of expected return. For core portfolios, the investment horizon needs to be long enough to garner the benefits from stock and bond investing but not so long that it obscures the risks that are likely to occur along the way. For example, a 20-year investment horizon minimizes the emotional risk of investing during periodic bull and bear cycles. Alternatively, a one-year time horizon makes stocks look very risky and minimizes the superior rewards stocks have provided versus other asset classes over time. EC Core Portfolio utilizes a five-year time horizon in allocating between stocks and bonds. Using historical returns and measures of volatility assuming

five-year holding periods, the best risk/reward tradeoff has been an allocation of 60% stocks and 40% bonds, which is the baseline allocation of the Portfolio (**Table 1**).

Chart 4 shows historical performance for rolling fiveyear buy and hold periods assuming annually an rebalanced 60/40 stock/bond portfolio. The average for all periods has produced an attractive return lower than a riskier all-stock portfolio (S&P 500) but well-above a lower return bond portfolio. The average of the five worst 60/40 periods significantly mitigated the losses of an allstock portfolio while still capturing 75% of the gain in the five best all-stock periods. As such, the major advantage of a 60/40 strategic allocation is the substantial reduction in volatility of investment returns bv diversifying the between two asset classes. Volatility is a source of psychological risk and is a significant factor investor's wherewithal to stay

committed to an investment plan. Historically, the five-year 60/40 mix has experienced volatility that is 30% less than the S&P 500 and about the same as an all-bond portfolio, which has produced superior risk-adjusted performance for the stock/bond allocation.

The baseline strategic allocation for the EC Core Portfolio is 60% stocks and 40% bonds. This allocation captured 75% of the gain in stocks while minimizing losses in declining market periods.

II. Tactical Asset Allocation

The EC Core Portfolio can dynamically adjust the base strategic allocation to respond to new sources of risk or to take advantages of the opportunities presented by the changing conditions in the global markets while maintaining the Portfolio's original risk/reward profile over time. The Portfolio achieves this via the annual strategic rebalancing and by incorporating the Equity Risk Management Strategy, both of which are based on pre-defined rules and implemented using proprietary portfolio construction models. The annual strategic rebalancing adjusts the stock/bond allocation depending on the current market conditions in relation to historical long-term performance. The Equity Risk Management Strategy is an all-equity strategy that dynamically manages the Portfolio's exposure to the equity markets — providing protection from equity market downside risks and volatility control while still maintaining the portfolio's ability to participate in enduring market advances.

Annual Rebalancing to Alter the Base Stock/Bond Mix

Strategic asset allocation is a long-term perspective for investing and not a short-term market forecast. Under normal circumstances, an annual realignment of the stock/bond allocation is sufficient to maintain the strategic risk and reward objective. In the intermediate term, there are times when it is prudent to position the investor for wealth creation after a lengthy bear market or to protect wealth after a prolonged bull market. The early 1980s experienced trailing five-year stock returns far below their historical average on the eve of an extended bull market. The opposite situation occurred at the end of 1999, when five-year returns were well above their historical average prior to a major bear market. During these abnormal periods, we make changes to the strategic allocation to counter the investment return anomalies and better optimize expected portfolio performance.

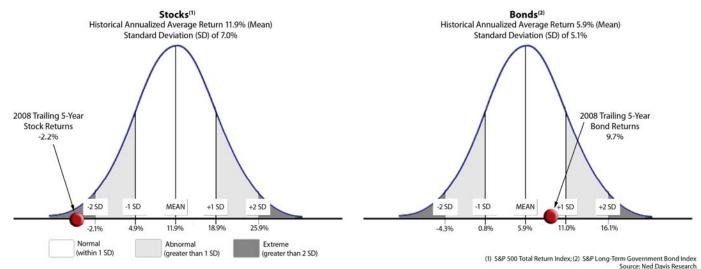

The methodology to over-/underweight stocks from the 60/40 allocation is illustrated in **Illustration 2**. The bell curves represent the average (mean) five-year annualized return and standard deviation for stocks and bonds. Standard deviation (SD) quantifies the volatility of past investment returns. Historical results within 1 standard deviation occurred 68% of the time and are considered in the normal range. Annualized returns greater than 1 standard deviation are abnormal, occurring between 68% and 96% of the time and extreme when the standard deviation is greater than 2. The five-year return of stocks by the end of 2008 was more than two standard deviations below its historical average. Bonds, on the other hand, are within their normal deviation range.

Tactical asset allocation addresses unusual periods of risk and opportunity to alter the strategic 60/40 mix.

Illustration 2

5-Year Annualized Buy & Hold Returns and Standard Deviations (SD) for Stocks and Bonds

31 Jan 1947 - 31 Dec 2008

The theory that stock returns are mean reverting over time is a observation compelling historical performance analysis. To incorporate an expectation extended periods abnormal or extreme stock returns are likely to be followed by normalizing performances, we adjust the strategic allocation using Table 3. The allocation adjustment corresponds to the determination that trailing fiveyear returns of stocks and bonds are abnormally or extremely above or below their average returns as shown in Illustration

2. The likely scenario or normal

Table 3

Strategic Stock/Bond Allocation Adjustment

Equity Allocation

			Sto	ocks		
		Extreme Below (>-2 SD)	Abnormal Below (>-1 SD)	Normal (Within 1SD Range)	Abnormal Above (> +1 SD)	Extreme Above (> +2 SD)
	Extreme Above (>+2 SD)	80 / 20	75 / 25	70 / 30	65 / 35	60 / 40
	Abnormal Above (>+1 SD)	75 / 25	70 / 30	65 / 35	60 / 40	55 / 45
Bonds	Normal (Within 1SD Range)	70 / 30 (Allocation for 2009)	65 / 35	60 / 40 (Base Allocation)	55 / 45	50 / 50
	Abnormal Below (>-1 SD)	65 / 35	60 / 40	55 / 45	50 / 50	45 / 55
	Extreme Below (>-2 SD)	60 / 40	55 / 45	50 / 50	45 / 55	40 / 60

range will make no adjustment to the 60/40 strategic allocation. Vectoring the extremely below performance of stocks in the last five years at the end of 2008 and normal range for bonds, the strategic allocation is adjusted to 70/30 for 2009.

Performance Simulation of Tactical Allocation Adjustments

The performance simulation of the strategic and tactical allocation methodology is shown in **Table 4**. This time period of 19 years experienced three bear markets (shaded area in **Table 4**) and two major bull markets, which is roughly representative of the market cycles in the last 100 years. The tactical rules shifted to underweight stocks from the long-run 60/40 allocation in the later stages of the bull market in 1998–2000. The strategic allocation was overweight stocks in 1993 to 1994 and in the bull recovery from 2003 to 2006. In the bear market of 2008, the tactical and strategic allocations were at the historical 60/40 mix, which did not inflect extra pain by being overweight to stocks.

Extended periods of above or below average performance of stocks and bonds are reasons to alter strategic allocation.

Dividends included in performance calculations (1) With Respect to the S&P 500 Index Source: EquityCompass Strategies, Ned Davis Research

The simulated cumulative returns for the strategic allocation in **Table 4** are unique in that they are higher than the cumulative results of stocks and bonds by themselves. This is a vivid demonstration of diversification and the discipline of rebalancing. Stocks, in particular, have underperformed in the simulation period from their historical average. While the relative return from bonds versus stocks is above average, the absolute return from bonds is close to their historic norm. Also not to be minimized is the substantial reduction in portfolio volatility that is the major countermeasure to the emotional risk of investing.

EquityCompass Equity Risk Manager — **Dynamically Manage the Exposure to Equity Markets**

While strategic and tactical allocation decisions are based on many years of historical performance, they do not necessarily reduce the risk of reacting emotionally to near-term market conditions. Understanding that an investment plan can provide some protection against a prolonged market decline better enables investors to stay invested during periods of market turbulence. EC Core Investing incorporates a risk-management overlay strategy known as the Equity Risk Manager "Risk Manager," which uses fundamental and technical indicators to adjust the exposure to equities.

The Equity Risk Manager does not engage in strategies to enhance return—but rather, seeks to reduce the risks of full equity exposure from an extended market decline. For example, persistent declines of expected earnings are a negative condition for stock performance. This overlay strategy will reduce the exposure to stocks in the overall portfolio.

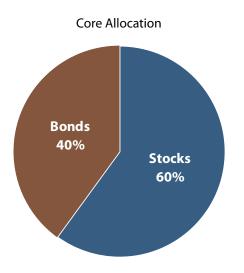

Risk Manager is the strategy to manage the equity exposure of the EC Core Portfolio. For example, if the strategic and tactical allocation is 60% stocks and 40% bonds, Risk Manager would represent a portion of the portfolio allocated to stocks (**Chart 5**). It is important to emphasize that Risk Manager is not a substitute for a dedicated, long-term equity portfolio. When market conditions are favorable, such as rising earnings expectations, the Risk Manager is fully invested and investors are exposed to the intended strategic allocation to stocks (i.e., 60%). If earnings fundamentals and technical indicators are negative, Risk Manager will reduce the equity exposure to about half the amount of the intended strategic allocation. Please refer to **Appendix II** for more specific details on the strategy.

The Equity Risk
Manager uses
fundamental and
technical indicators
to adjust equity
exposure, seeking to
reduce risk from an
extended market
decline.

Chart 5

EC Core Portfolio

Strategic Allocation With/Without Equity Risk Manager

Performance Simulation of Risk Manager

Table 5 shows a simulated portfolio that is strategically and tactically allocated and incorporates the Risk Manager for 33% of the stock allocation (**Chart 5** with Risk Manager). Losses were substantially mitigated in the two largest negative years (2002 and 2008) by having the Risk Manager in the simulation. Conversely, there are periods in which the Risk Manager held back or reduced market gains (1991 and 2003). The indicators used for the Risk Manager are generally lagging when stocks bottom from a bear market and begin recovering. Risk Manager reflected the returns of the equity market in most years except transition periods. The Risk Manager provided protection from an extended bear market and lowered the volatility of the overall portfolio.

III. Portfolio Construction

EC Core Portfolio is a mix of actively and passively managed portfolios consistent with the allocation strategy. Passive strategies, utilizing Exchange-Traded Funds (ETFs), are used where it is difficult to add superior risk-adjusted performance to the market return. Active strategies are used where a combination of portfolio construction tactics and security selection provide the potential for risk-adjusted performances superior to the market return. This approach provides a reliable capture of market or index returns and potential for excess return where we believe exploitable opportunities exist.

Another focus of portfolio construction is efficient implementation and sensitivity turnover considerations. The EC Core Portfolio is designed as a

moderate to low turnover strategy.

Chart 6 **EC Core Portfolio**

Equity Allocation

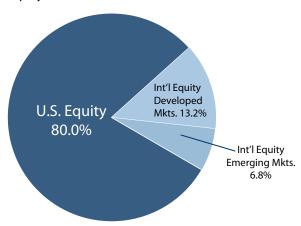

Table 6

U.S./International Stock Allocation

Annualized Rolling 5-Yr Buy & Hold Returns | 1 Jan 1975 – 31 Dec 2008

Equity Allocation

The equity component of the EC Core Portfolio invests in U.S. and international stocks. The allocation between domestic and international is determined from analysis of historic five-year reward/risk performances (Table 6). The allocation at the end of 2008 was 80% domestic and 20% international. As shown in **Table 7**, with the exception of 2008. international stocks have outperformed U.S. stocks since 2002. In the last five years, markets have tripled emerging performance of U.S. stocks. As a result, international stocks have become a growing component of equity investing and there is considerable interest in emerging markets such as China, Brazil, and India and their

growth potential. Given their growing prominence, emerging markets account for one-third of the international allocation with the remaining two-thirds allocated to developed international markets. However, we have kept the allocation to these international markets consistent with historical figures since they remain very volatile and are still highly correlated to the U.S. markets. Also, their risk-adjusted performance is below the S&P 500 in the 20-year study period (Table 7).

U.S. Equity Portfolio

The actively-managed EquityCompass U.S. All-Cap Blend Model Portfolio (the "All-Cap Blend") represents the allocation to domestic equity. The All-Cap Blend seeks to outperform the S&P 500 by following a disciplined stock selection process and a portfolio construction process that maximizes expected returns by controlling the portfolio volatility.

The equity allocation consists of an actively managed U.S. equity portion using the EquityCompass U.S. All-Cap Blend Model Portfolio and passive exposure to international markets using exchange-traded funds.

The Stock Selection Process

EquityCompass employs a disciplined stock-selection process that combines traditional fundamental analysis with comprehensive quantitative modeling. EquityCompass has a coverage universe of 3,000 domestic stocks and relies on in-house data that is published monthly as part of its research service. Individual stock opinions are derived from investment insights that demonstrate a statistically significant potential to contribute excess returns.

The four cornerstones of stock analysis:

Valuation:

Ranks stocks relative to the broader universe based on company fundamentals

Momentum:

Ranks stocks based on long-term relative price momentum

Over-/Underreaction:

Identifies significant misalignments between stock price and fundamental expectations

Quality:

Ranks stocks relative to the broader universe based on factors that create long-term shareholder value

Stocks with the most favorable of these attributes are assigned a "Buy" rating and the least favorable are "Sell." Specifically for the All-Cap Blend, the Buy-rated stocks are further refined by criteria such as minimum price (\$7.50) and minimum daily trading volume (200K), and are then ranked based on fundamental analyst opinion (consensus estimates). Incorporating analyst opinion is a reality check that helps minimize stock selection that is favorable on quantitative criteria but undesirable from a qualitative analysis.

EquityCompass employs a disciplined stock selection process focusing on valuation, momentum, quality and investor over-/ underreaction.

Portfolio Construction

The All-Cap Blend utilizes the insights for stock selection along with portfolio construction tactics that we believe will contribute to superior riskadjusted performance. Our analyses show that a portfolio that features equal weighting of stock positions, equal weighting among the 10 S&P market sectors, equal weighting (on average) to growth and value investment styles, and maintaining equal representation in all market-cap segments (large-, mid-, and smallcap) exhibits the most efficient risk/return profile. While each of these attributes do have their periods of excess return. their occurrence is random. Balancing the portfolio attributes reduces t h e performance vulnerability when they are out of favor and thus improves risk-adjusted performance (Charts 9 & 10).

The All-Cap Blend portfolio has 50 equally weighted, sector-balanced stock

Chart 9

Table 8

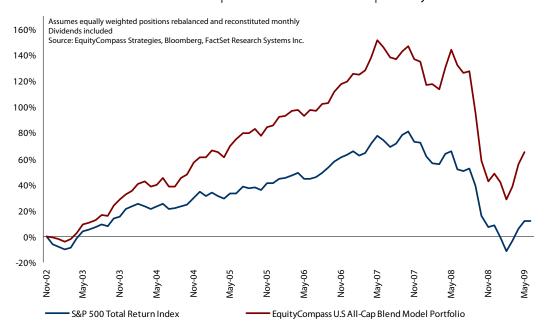

Performance Simulation of the All-Cap Blend Model Portfolio

The cumulative performance of the All-Cap Blend Model Portfolio is shown in **Chart 11** and calendar year performance is shown **Table 9**. The All-Cap Blend outperformed the S&P 500 in each of the calendar years of the simulation. In terms of risk-adjusted performance, the All-Cap Blend showed slightly higher volatility than the S&P 500 **due mostly to the higher returns over the period**. The Sharpe Ratio, indicative of risk-adjusted performance, was substantially higher and the portfolio beta as of June 30, 2009 was 0.91.

Fixed Income Allocation

The fixed income strategy of the Core Portfolio emphasizes credit quality and capital stability for the portfolio. The strategy does not engage in active management such as interest rate anticipation, sector swaps, yield curve spreads, or quality spreads. Recent analysis by Standard & Poor's indicates that more than 75% of fixed income managers pursuing these types of active strategies have not outperformed passive benchmarks. The EC Core Portfolio will utilize ETFs that track various passive fixed income indices.

The investment strategy of core investing is to balance interest rate and credit risk by equalizing allocations to bond maturities and by owning U.S. government and

portfolio that is in U.S. Government securities.

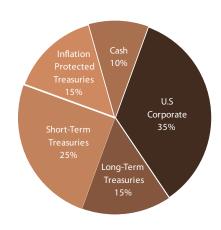

investment grade bonds. The Portfolio will not allocate to High Yield or foreign bonds. An example of balancing interest rate risk is having 15% of the portfolio allocated to long-dated U.S. Government bonds that are usually the most sensitive to higher interest rates in response to higher inflation. The inflation risk is balanced by allocating 15% of the portfolio to Treasury Inflation Protected Securities (TIPS). This 30% of the portfolio allocated to long maturities is balanced against 35% of the portfolio that is allocated to cash and short-term Treasuries. Investment grade bonds, representing 35% of the portfolio, provide the highest current yield in the fixed income allocation; the increased credit risk is offset by the remaining 65% of the

As of June 30, 2009, the duration of the fixed income portfolio was 5.7 years with a weighted average maturity of 10 years and 53% of the portfolio has maturities of five years or less. The weighted average coupon yield of the portfolio was 4.1%.

IV. Portfolio Management

Portfolio management is the ongoing implementation, maintenance, and performance measurement of the investment strategy. There are three steps in the EC Core Portfolio management process:

- Coordinated and disciplined implementation of the decision-making rules developed from the guiding investment philosophy, dynamic allocation strategies, and portfolio selections.
- 2) Active rebalancing, risk monitoring, and periodic review of asset allocation and portfolio construction guidelines.
- 3) Continuous performance and risk measurement and analysis.

The permanent aspect of the EquityCompass portfolio management process is the strict adherence to the investment philosophy and investment decisions that guide decision-making. The EC Core Portfolio is designed to be the foundation of an investment portfolio and adheres to the core/satellite approach for portfolio construction. Strategic allocation between stocks and bonds forms the foundation of the portfolio, while tactical asset allocation and a stock selection process that rely on statistically derived rules rather than economic or market forecasting opinions provide it the ability to generate superior risk-adjusted returns.

The dynamically managed aspects of the Portfolio are the tactical strategies and active risk management techniques that periodically review and revise strategic asset allocation, the degree of exposure to individual markets, portfolio selections in the stock and bond sub-classes, and overall weighting optimization. The active equity component of the EC Core Portfolio is monitored continuously for opinion changes that would potentially impact portfolio composition.

The EC Core Portfolio aims to effectively capture market returns without assuming additional risks. The performance benchmark for the Portfolio is the blended annual return of 60% S&P 500 Total Return Index (inclusive of dividends) and 40% Barclay's Capital Aggregate Bond Total Return Index. EquityCompass constantly monitors the Portfolio's performance and the risk assumed in the process to ensure adherence to pre-defined objectives.

EC Core Portfolio is dynamically managed and disciplined to stay focused on achieving its investment obiective.

Performance Simulation of EC Core Portfolio

The full performance simulation of the EC Core Portfolio starting November 2002 is shown in **Table 11**. The benchmark for performance comparison should be a mix of 60% S&P 500 Total Return Index and 40% Barclays Aggregate Bond Index (the "60/40 benchmark" or the "Benchmark"). The EC Core Portfolio outperformed the 60/40 benchmark, cumulatively and in each of the calendar years in the study period. Importantly, portfolio volatility (annualized standard deviation) was less than the Benchmark and produced significantly higher risk-adjusted performance (Sharpe Ratio). Using the S&P 500 as the benchmark, the EC Core Portfolio captured 69% of the market upside, while successfully limiting it to 38% on the downside.

A Note on EquityCompass Performance Simulation

The performance simulation begins in 2002, the year in which the complete EquityCompass stock ratings were first published. All criteria used for the initial construction of the portfolio constituents, as well as all subsequent changes, are based on out-of-sample data as of the most recent month-end at the time that the ratings were derived. Many of the historical members in this portfolio do not exist today for various reasons including acquisition, delisting, merger, bankruptcy, etc. If a company was covered at the time of each monthly evaluation, then it was considered to have been eligible for inclusion in the portfolio at each simulated interval. All portfolio rules are assessed monthly corresponding to the ratings date on all EquityCompass covered stocks.

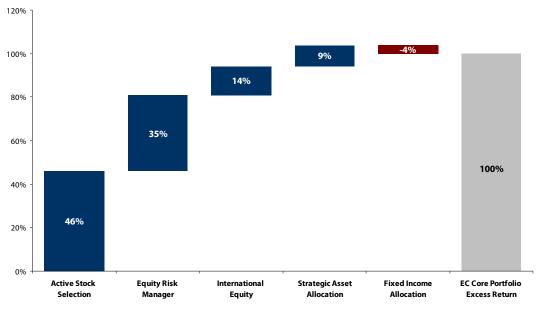

EC Core Portfolio Excess Return Attribution Analysis

An analysis of the sources of excess return in the portfolio simulation of the EC Core Portfolio versus the 60/40 Benchmark portfolio is provided in **Chart 13** (the EC Core Portfolio generated an annualized return 5.4% more than the 60/40 Benchmark). The largest contributor of excess return during the study period was the actively managed U.S. stock portfolio (All-Cap Blend), which accounted for 46% of the outperformance. The risk management overlay, Risk Manager, was the second largest contributor — 35% of the excess return. As noted in **Table 11**, the EC Core Portfolio simulated returns with and without the Risk Manager were similar over the study period except for the significant reduction in the portfolio volatility when the Risk Manager was included. The allocation to international stocks (13%) and the tactical asset allocation (9%) were the other contributors to the total excess return of 5.4%. The only negative contributor to the outperformance was the fixed income component (-4.0%), which was essentially due to a higher allocation to cash when compared to the benchmark.

We believe a major benefit of EC Core Portfolio is that it adds value from various sources. In other words, there is no single driver of excess returns and as the annual-return analysis demonstrates, the contribution of the attribution elements can and will change from year to year. For example, while the Risk Manager proved to be a major contributor to the 2008 excess returns, it was a negative drag to results in 2003. These variable sources of potential return are also a major factor in smoothing the volatility of the portfolio.

Chart 13

EC Core Portfolio Excess Return Attribution Analysis (1)
29 Nov 2002 - 30 Jun 2009 | Monthly Data

Dividends included

(1) EC Core Portfolio outperformed the benchmark (60% S&P 500 and 40% Barclays Agg. Bond Index by 5.4% in performance simulations. Please refer to Table 11 for the full performance simulation results.

The performance simulation of the EC Core Portfolio demonstrated superior returns versus the S&P 500, bonds, and a 60/40 stock/bond mix on an absolute and risk adjusted basis. Incorporating the Risk Manager greatly reduced downside market capture and portfolio volatility.

Summary

As investors evaluate an investment strategy, there are three important questions to consider:

- 1) Does the investment strategy offer an advantage versus a passive alternative?
- 2) Are the investment results explainable and acceptable to capital market theory, investment principles, and realistic practices?
- 3) Can past performance be repeated in the future?

The first two questions can be answered by analyzing the investment process to understand portfolio decision-making. This report has provided a detailed description of core investing to specifically address the first two questions. There is no claim of superior forecasting, market timing expertise, or exceptional stock-picking ability. There are no vague references to proprietary models to explain how investment results are generated. Instead, the EC Core Portfolio demonstrates how sound investment principles are transparently used for decision-making to manage a comprehensive portfolio. Past performance is no guarantee of future results. We believe by disclosing decision-making, investors have the information to better anticipate how the investment process may perform in the future. While this analytical approach may lack the shortcuts provided by marketing slogans, we strongly believe it is an important basis for answering the all-important third question.

Investors should assess the likelihood that an investment process can be successful in the future rather than merely extrapolating past results.

Appendix II

EquityCompass Equity Risk Management Strategy

The EquityCompass Equity Risk Management Strategy ("ERMS" or the "Strategy" or "EC Equity Risk Manager") is an adaptable approach addressing investor uncertainty on market direction. Based on fundamental and technical indicators, the Strategy seeks to manage an investment portfolio's exposure to the equity markets thus mitigating the risk of an extended market decline while also seeking to participate in enduring market advances. The ERMS is designed to integrate within a strategic allocation to stocks without the use of leverage or complex derivative instruments. Importantly, the Strategy allows the investor to make objective investment decisions rather than reacting to emotional pressures that usually prevail in volatile market conditions.

EC Equity Exposure Index

The EC Equity Exposure Index (the "Index") is a quantitatively derived score that ranges from 10% to 100% and reflects the current favorability towards investing in stocks. A higher percentage reflects favorable conditions for investing while lower percentages are unfavorable. The Index is updated monthly by EquityCompass Strategies based on scores generated from two models — one looks forward and tracks the fundamental indicators and the other relies on historical probabilities to analyze technical indicators. The fundamental model scores range from 0% (unfavorable) to 100% (favorable) and the technical model scores range from 20% (unfavorable) to 100% (favorable). Each model score is given a weight of 50% to produce the EC Equity Exposure Index.

Fundamental Model

The fundamental model measures changes in consensus analyst estimates for the S&P 500 in the next 12 months. Two consecutive months of rising earnings expectations generate the positive signal that turns the model favorable toward stock investment. The model stays favorable until two consecutive months of decreasing expectations reverse the signal to negative. Analyst estimates are generally consistent with the market direction except in periods of major directional change, when they have been seen to lag. Since 1989 there have been seven directional changes with the most recent being a negative reversal that occurred in July 2008 (Chart 14).

Chart 14

Directional Changes in the Fundamental Model

The Technical Model

The technical model is based on the historical (1916–2008) DJIA performance. The matrix shown in **Table 12** was constructed using the variables of the then DJIA relative to its all-time high and subsequent low. The matrix was then optimized to generate scores that range from 20% to 100% to indicate the desired degree of equity market exposure that produced the best possible returns over the period. This model tries to avoid the overt bias to price momentum or mean reversion tendencies from which many technical models suffer. Since 1989 there have been 28 month-end index exposure changes of greater than 20%.

EC Equity Risk Management Strategy

The EC Equity Exposure Index forms the basis for the Equity Risk Management Strategy, a tactical strategy that can be employed to systematically reduce the risk of extended market declines while adjusting to capture enduring market advances. The ERMS expands the portfolio flexibility to inverse, or short, the S&P 500 when the EC Equity Exposure Index is unfavorable for owning stocks. As such, the ERMS will have a portfolio that is a combination of either long the S&P 500, short the S&P 500, or cash. Using the monthly EC Equity Exposure Index as a basis, **Table 13** shows the matrix determining the allocation to the various components of the ERMS portfolio. For example, when the composite equity allocation is 80%, the ERMS will allocate 20% to cash and 80% to the S&P 500. When the recommended equity exposure is only 20%, the ERMS will have 20% in cash and 80% inverse, or short, the S&P 500. The ERMS is updated monthly based on changes to the EC Equity Exposure Index.

Table 13 <u>EC Equity Risk Manager Component Allocation</u>

			Equity Risk Ma emponent Alloc

ERMS Portfolio Simulation

We performed a portfolio simulation for the ERMS covering the same study period as was used for the EC Equity Exposure Index (12/31/89–3/31/09). The cumulative results of the simulation are shown in **Chart 15** and period returns are shown in **Tables 14** and **15**. The study period includes a decade of well above average performance (1990–1999) and what is shaping up as one of the worst (2000–2009), providing stress conditions to test how well the ERMS was able to capture enduring market advances as well as avoid the ravages of extended market declines. Buy and hold strategies became popular in the 1990s as the fully invested S&P 500 outperformed the vast majority of active portfolio managers.

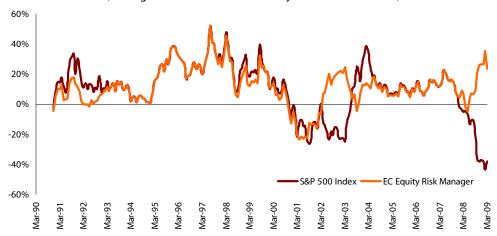

However, the ERMS still captured the majority of the market gains with an annualized return of 16.1% versus 18.2% for the S&P 500. As far as returns since 2000, the ERMS simulated an annualized return of 4.1% versus -2.0% for the S&P 500.

The flexibility of the ERMS to position inverse, or short the S&P 500 is best demonstrated by performances in 2008. With the EC Equity Exposure Index indicating very unfavorable conditions for owning stocks, the ERMS was either in cash, or short the S&P 500 most of the year. Perhaps one of the most useful statistics from the performance simulation is the upside/downside capture ratio. The ERMS was able to capture 68.5% of the gain when the S&P 500 was rising while capturing 28.5% when it was declining.

Important Disclosures

The information contained herein has been prepared from sources believed to be reliable but is not guaranteed and is not a complete summary or statement of all available data nor is it considered an offer to buy or sell any securities referred to herein. EquityCompass Strategies is a research and investment advisory unit of Choice Financial Partners, Inc., a wholly owned subsidiary and affiliated SEC registered investment adviser of Stifel Financial Corp. Portfolios based on EquityCompass Strategies are available exclusively through Stifel, Nicolaus & Company, Incorporated. Affiliates of EquityCompass Strategies may, at times, release written or oral commentary, technical analysis, or trading strategies that differ from the opinions expressed within. Opinions expressed are subject to change without notice and do not take into account the particular investment objectives, financial situation, or needs of individual investors. The S&P 500 Index is a broad market index that tracks the performance of 500 stocks from major industries of the U.S. economy. The FINRA-Bloomberg Active U.S. Corporate Bond Indices reflect activity for the most frequently traded fixed-coupon investment-grade and high-yield bonds. When investing in bonds, it is important to note that as interest rates rise, bond prices will fall. The CRB Index is the Commodity Research Bureau Index that measures the overall direction of commodity sectors, which is designed to isolate and reveal the directional movement of prices in overall commodity trades. The MSCI US REIT Index is designed as a broad representation of REITs. The MSCI Emerging Markets Index is designed to measure equity market performance in global emerging markets. The Emerging Markets Index is a float-adjusted market capitalization index. Investing in Emerging Markets may involve greater risk and volatility than investing in more developed countries. The volatility of the indices identified in this report may be materially different from the volatility of the model portfolios presented by EquityCompass Strategies. Indices are unmanaged, and it is not possible to invest directly in an index.

When investing in bonds, it is important to note that as interest rates rise, bond prices will fall. The risk of loss in trading commodities and futures can be substantial. You should therefore carefully consider whether such trading is suitable for you in light of your financial condition. The high degree of leverage that is often obtainable in commodity trading can work against you as well as for you. The use of leverage can lead to large losses as well as gains. High-yield bonds have greater credit risk than higher quality bonds. Corporate bonds are considered higher risk than government bonds. Investing in emerging markets may involve greater risk and volatility than investing in more developed countries. There are special considerations associated with international investing, including the risk of currency fluctuations and political and economic events. Foreign investments are subject to risks not ordinarily associated with domestic investments, such as currency, economic and political risks, and different accounting standards. Currencies and futures are generally volatile and may not be suitable for all investors. Investment in foreign exchange related products is subject to many factors which contribute to or increase volatility, such as national debt levels and trade deficits, changes in domestic and foreign interest rates, and investors' expectations concerning interest rates and global or regional political, economic or financial events and situations. The funds will be successful only if significant losses are avoided. Please review the prospectus regarding specific break-even figures for the funds. Exchange Traded Funds (ETFs) represent a share of all of the stocks in their respective index held in a trust. Therefore, ETFs are subject to market risk, including the possible loss of principal. The value of the portfolio will fluctuate with the value of the underlying securities. ETFs trade like stocks, and there will be brokerage commissions associated with buying and selling exchange traded funds unless trading occurs in a fee-based account. Investors should consider an ETF's investment objective, risks, charges, and expenses carefully before investing. The prospectus, which contains this and other important information, is available from your Financial Advisor and should be read carefully before investing. Due to their narrow focus, sector-based investments typically exhibit greater volatility and are generally associated with a high degree of risk. Small company stocks are typically more volatile and carry additional risks, since smaller companies generally are not as well established as larger companies. The market risk associated with small-cap and mid-cap stocks is generally greater than that associated with large-cap stocks because small-cap and mid-cap stocks tend to experience sharper price fluctuations than large-cap stocks, particularly during bear markets. Investing in low-priced securities carries a high degree of risk and may not be suitable for all investors. When investing in real estate, it is important to note that property values can fall due to environmental, economic, or other reasons, and changes in interest rates can negatively impact the performance of real estate companies. There is no guarantee that the figures or opinions forecasted in this report will be realized or achieved. Past performance is no guarantee of future results. Buy-Sell-Hold and other research ratings utilized by EquityCompass Strategies are provided by an outside entity that may rely on information created by the Stifel Nicolaus Research Department.
